

(a)

tier 1: leaders

red leader

gold leader

tier 2: wingmen

red wingman 1

gold wingman 1

red wingman 2

gold wingman 2

...

...

decreasing precedence
↓

key = (tier, squadron, index)

total, so every pair is decided

(b)

wingman yields to wingman

both can manoeuvre, and the order lets only one of the pair brake, so neither is left stationary in the other's path

wingman yields to leader

a leader holds speed and does not yield to a wingman, so braking here guarantees the collision rather than avoiding it
